

LCC

SMART PLANT SYSTEMS (MICRO:BIT + 3D DESIGN)

STUDENT'S NAME:

Key Concept: Systems

Related Concepts: Development, Function & Innovation

Global context: Scientific and Technical Innovation

STATEMENT OF INQUIRY

Understanding how systems function and develop allows us to design innovative solutions that use technology to monitor and improve environmental conditions.

Factual question: What environmental factors affect plant growth?

Conceptual question: How can data help us make better decisions?

Debatable question: To what extent should we rely on technology to manage natural systems?

ASSIGNMENT SUPPORT

Flower Pots Buying Guide

The Best Types of Pots for Plants

30 Indoor Plants That Like Direct Sunlight

THE CHALLENGE

Unit: Smart Plant Systems (Micro:bit + 3D Design)

Grade Level: Middle/Secondary

Duration: 5 Lessons (60–75 min each)

Subjects: Design, Technology, Science

Unit Overview

Students will design and grow a plant in a custom 3D-printed pot while building a micro:bit-based sensor system to monitor environmental conditions (light, temperature, and soil moisture). They will use data to make informed decisions about plant care.

Learning Objectives: By the end of this unit, students will be able to: Explain how environmental factors affect plant growth

Design a functional, plant-specific pot using CAD software

Program a micro:bit to collect and transmit environmental data

Interpret sensor data to improve plant care

Reflect on the effectiveness of their design and system

Formative Assessment: Research completion - CAD design progress - Coding checkpoints

Summative Assessment: Clear understanding of plant needs: Justification of design decisions - Functional pot (size, drainage, usability) - Micro:bit collects accurate data - Successful radio communication - Uses data to make decisions about plant care - Thoughtful analysis and improvements

3D POT DESIGN

LESSON 1

A // INQUIRING & ANALYZING

Choose a plant (herb, succulent, etc.)

Research

- Sunlight needs
- Ideal temperature range
- Soil moisture requirements
- Pot size and drainage

Extra Points: Research at least 2 different plants in order and compare different needs.

Include images, videos & links

**KEEP YOUR
ANSWERS BRIEF!**

LESSON 2 B // DEVELOPING IDEAS

Sketch out 3 different ideas on what your pot may look like.

Key pot design features:

- Drainage holes
- Size and depth
- Stability
- Aesthetic design

Based on your chosen plant, which features do you think will be most important?

PRESENT

Present a range of feasible design ideas, which can be correctly interpreted by others.

... insert a description of your design.

... insert a description of your design.

... insert a description of your design.

Present the chosen design and outline the reasons for its selection

... describe why your group chose this design.

CLICK ON ME!

CREATING THE SOLUTION

STEP 1

- **Create a CAD model of their pot**
- **Add annotations explaining:**
 - **Why size/shape suits plant**
 - **How drainage is addressed**

STEP 2

- **Finalize CAD designs**
- **Export and prepare files for printing**
- **Begin 3D printing (teacher may manage print queue)**

CREATING THE SOLUTION

Demonstrate excellent technical skills when making the solution

Document your process of building your physical prototype. Show me some of the steps you take while building your design.

... describe what is being depicted.
(Add annotations and arrows to your pictures, too!)

PLANT MONITORING WITH MICRO:BIT SENSORS

A // INQUIRING & ANALYZING

Based on the plant you researched above, what are its most important needs (moisture, temperature, amount of light, etc.)?

Make a list of the most important things that you should be *monitoring* to keep your plant happy and healthy.

Write out a brief description of how you would want to get that information from your plant.

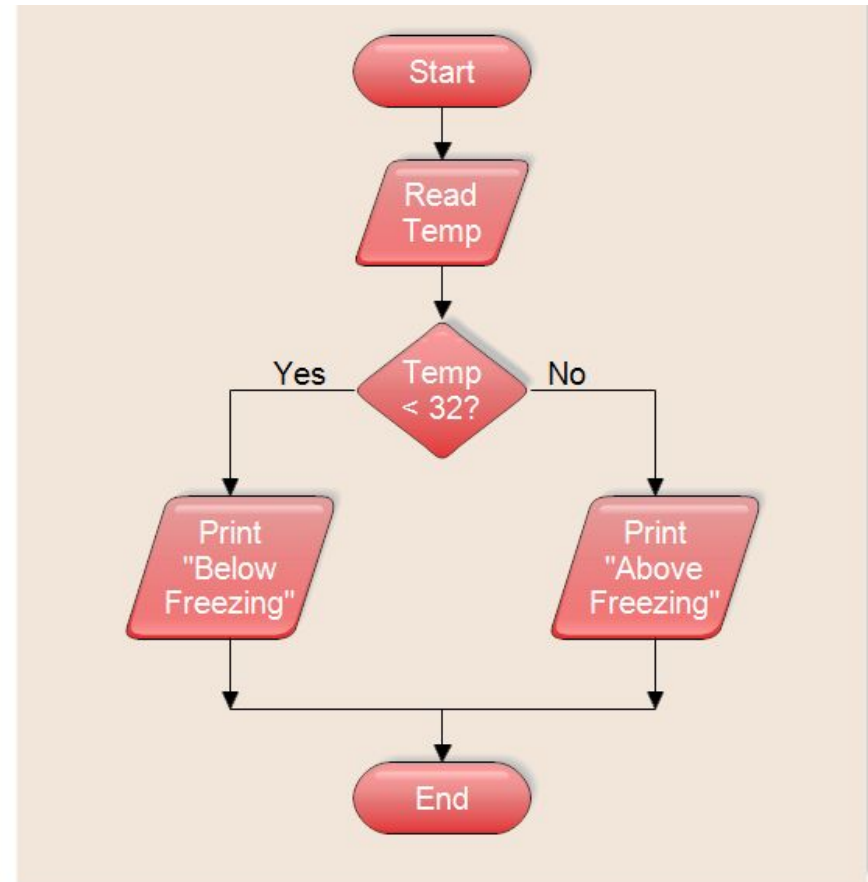

**KEEP YOUR
ANSWERS BRIEF!**

LESSON 2 B // DEVELOPING IDEAS

For each group member, write or draw, step by step, a process for how you can take information from a LIGHT SENSOR, a THERMOMETER, and/or a SOIL MOISTURE SENSOR, and send it to another device.

Don't just think about collecting the information — how would you want it *presented* to you? What would make it clear what you're reading? How often will you need to collect data? How often will you be able to read it?

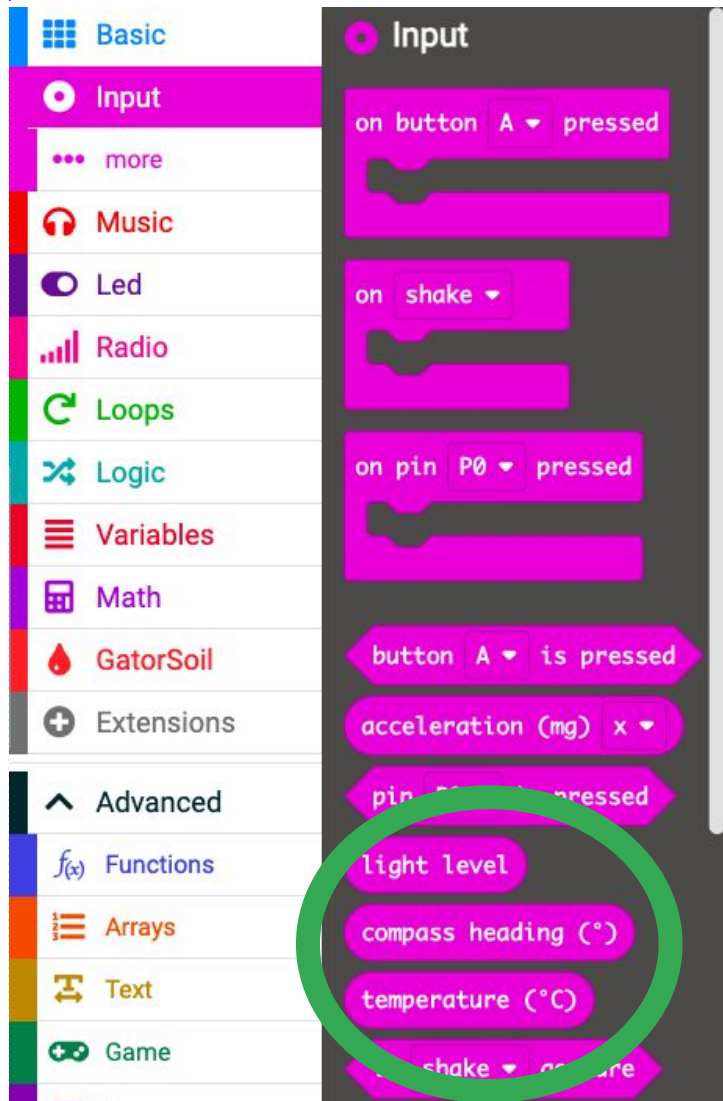

Share your instructions with your partners. Can they follow along? Are you missing any steps?

micro:bit sensors

micro:bit sensors

micro:bits have sensors that can gather data on a wide range of information.

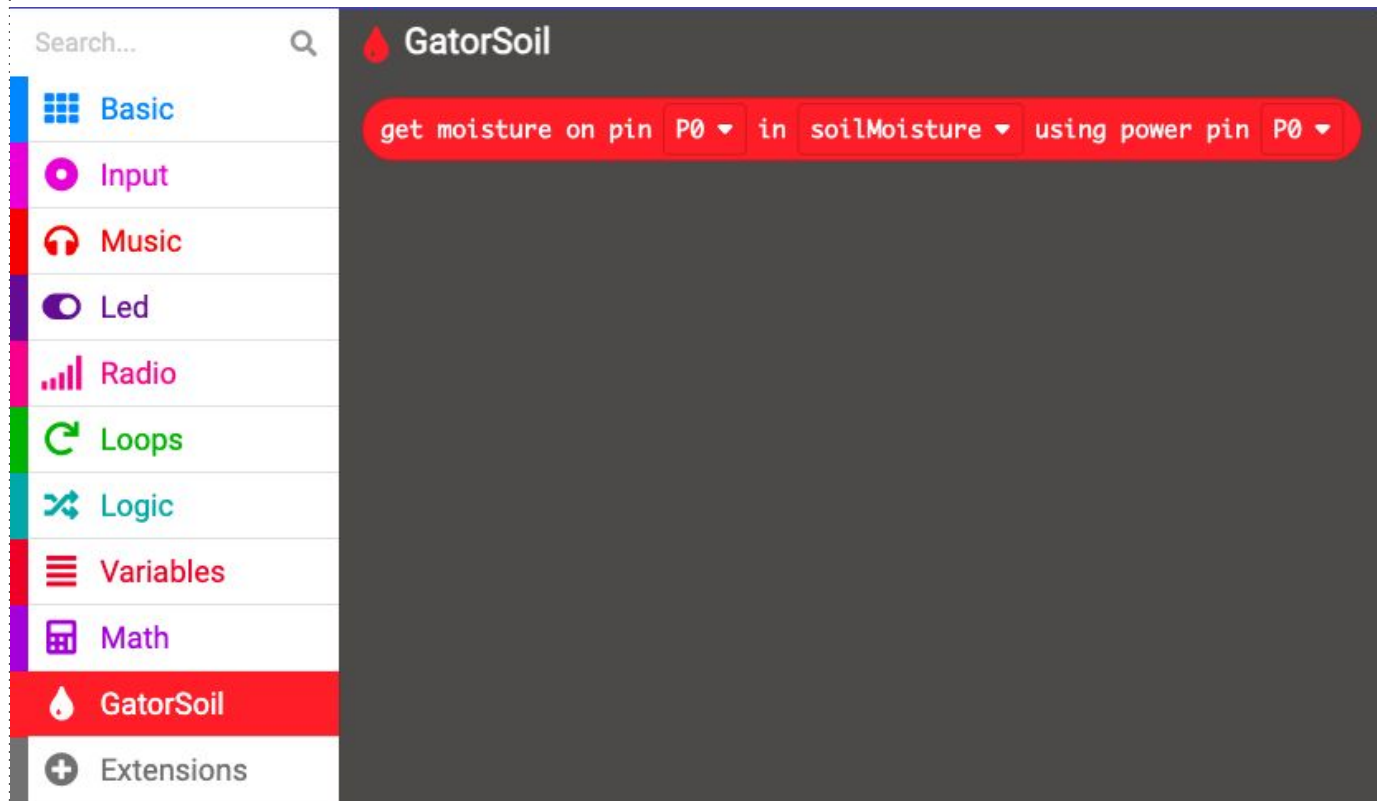

some of these sensors are built in to the micro:bit, and some can be connected to it via pins.

some internal sensors you might find useful are the **led light sensor**, which can determine the amount of ambient light in the room, and the **thermometer**, which measures temperature.

micro:bit sensors

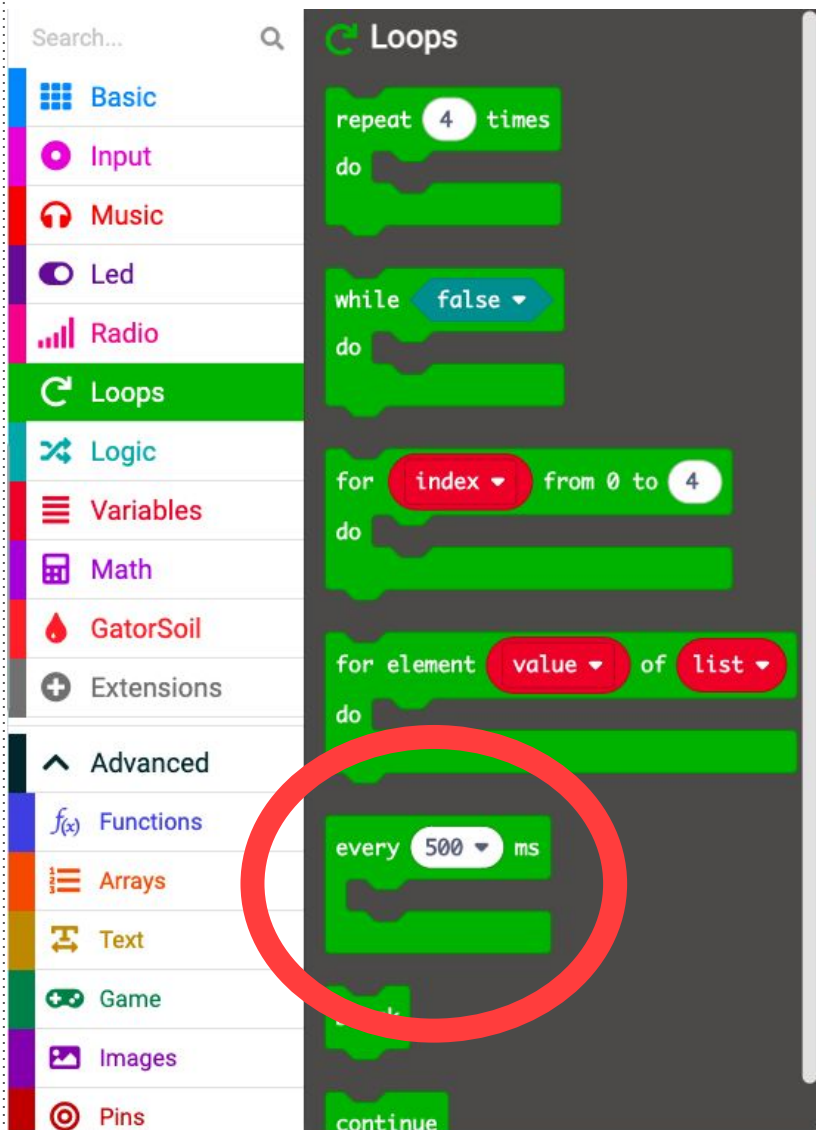

you might also use a separate soil moisture sensor, which requires a separate extension called gatorsoil.

to install extensions, click on “extensions” and type in what you’re looking for.

this will add its functions to your library!

loops

you'll probably need to check levels at regular intervals to make sure your plant stays healthy for as long as possible.

we can use loops to do the same thing over and over.

makecode gives you a lot of options for looping, like choosing a number of times, a true/false statement, or a time interval.

you'll probably want to use a time interval for your data, but what could you use the other options for?

remember: there are **1000 ms** in a second!

sample code

here's some (incomplete) code for the sensor. what does each line do?

how could you improve it?

what is it missing?

what could you do to make the data easier to access or easier to read?

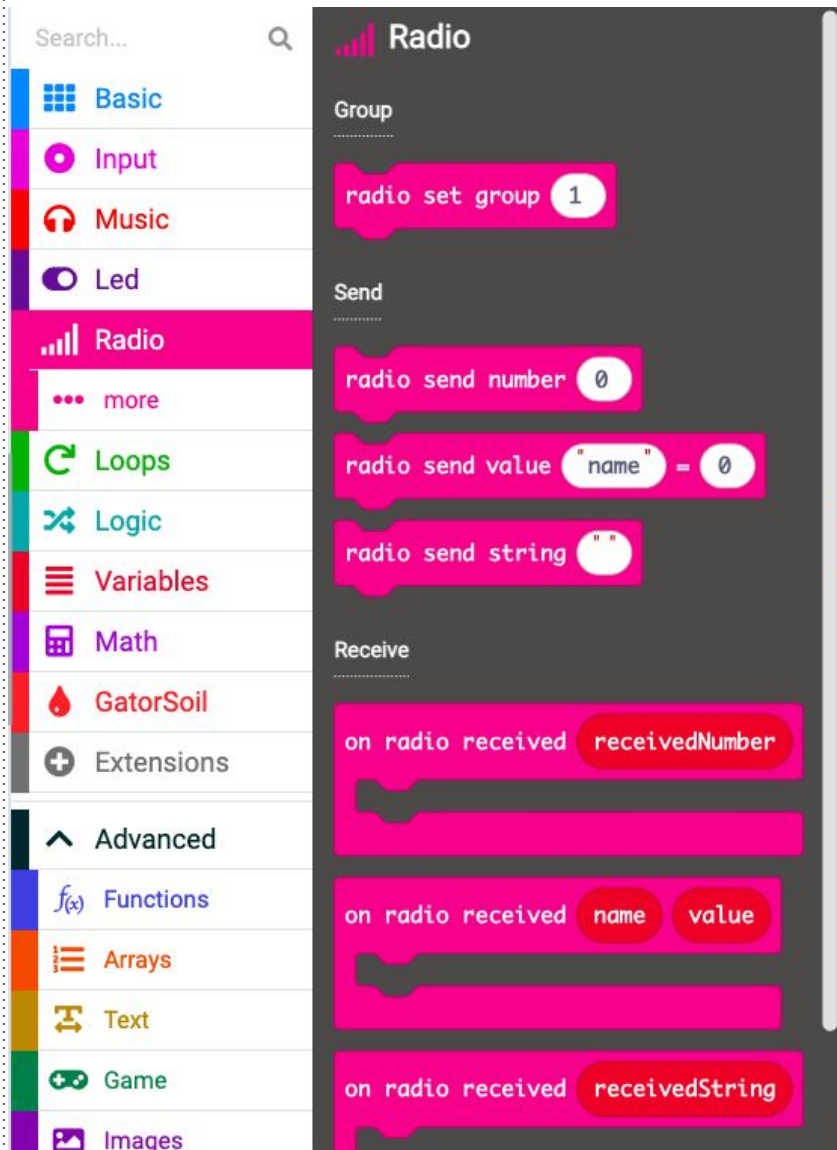

```
every 60000 ms
  show string get moisture on pin P0 in soilMoisture using power pin P3
  show string light level
  show string temperature (°C)
```

advanced micro:bit techniques

all of the techniques on the following six slides are **optional** for this assignment.

but if you want to **challenge yourself** to make something that really works as a sensor, i recommend giving them a try!

radio

you've been given two micro:bits. micro:bits are able to communicate with one another, which allows you to send information from one to another.

this means that you can set up one micro:bit in your pot, and use the other one to send data to your ipad or laptop through usb or bluetooth.

consider: are you going to always be able to connect to the sensor? how often are you going to be able to collect data?

one important note if you want to use radio functions: make sure you set both micro:bits to the same group!

arrays: writing

micro:bit
advanced

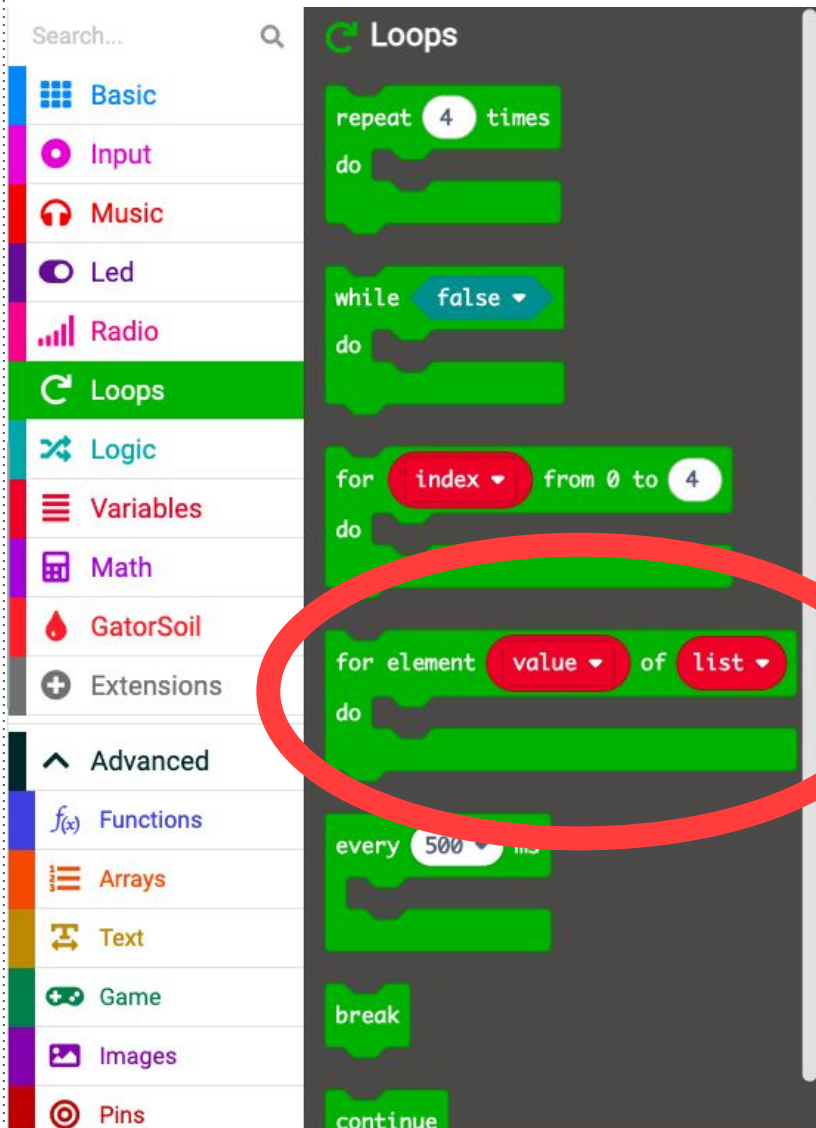

The screenshot shows the Micro:bit Advanced code editor interface. On the left is a sidebar with various categories: Basic, Input, Music, Led, Radio, Loops, Logic, Variables, Math, GatorSoil, Extensions, Advanced, Functions, Arrays, Text, Game, Images, Pins, and Serial. The 'Arrays' category is selected and highlighted in orange. The main workspace contains several code blocks. Two blocks are circled in purple: the top one is 'set list to array of' with values 0 and 1, and the bottom one is 'list set value at' with index 0 and a value field. Other visible blocks include 'set text list to array of' with values 'a', 'b', and 'c', 'empty array', 'length of array', 'list get value at', 'list get and remove value at', 'get and remove last value from list', 'get and remove first value from list', 'get random value from list', and 'list add value to end'.

you might want to collect a lot of data and send it all at once. instead of making a new variable for each point, we can use arrays.

arrays are lists of text or numbers that are all saved and sorted together in the micro:bit's memory.

if you add a new value to the end of an array, it doesn't erase anything you added before; now you can have all of your data saved forever (or until the micro:bit runs out of memory)!

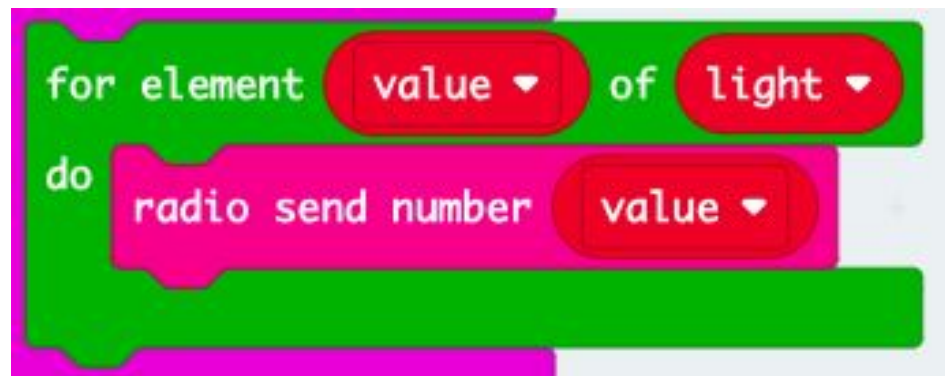

arrays: reading

now that you've got all of your data neatly sorted in order in an array, how can you get it back out again?

let's look at that list of loops again.

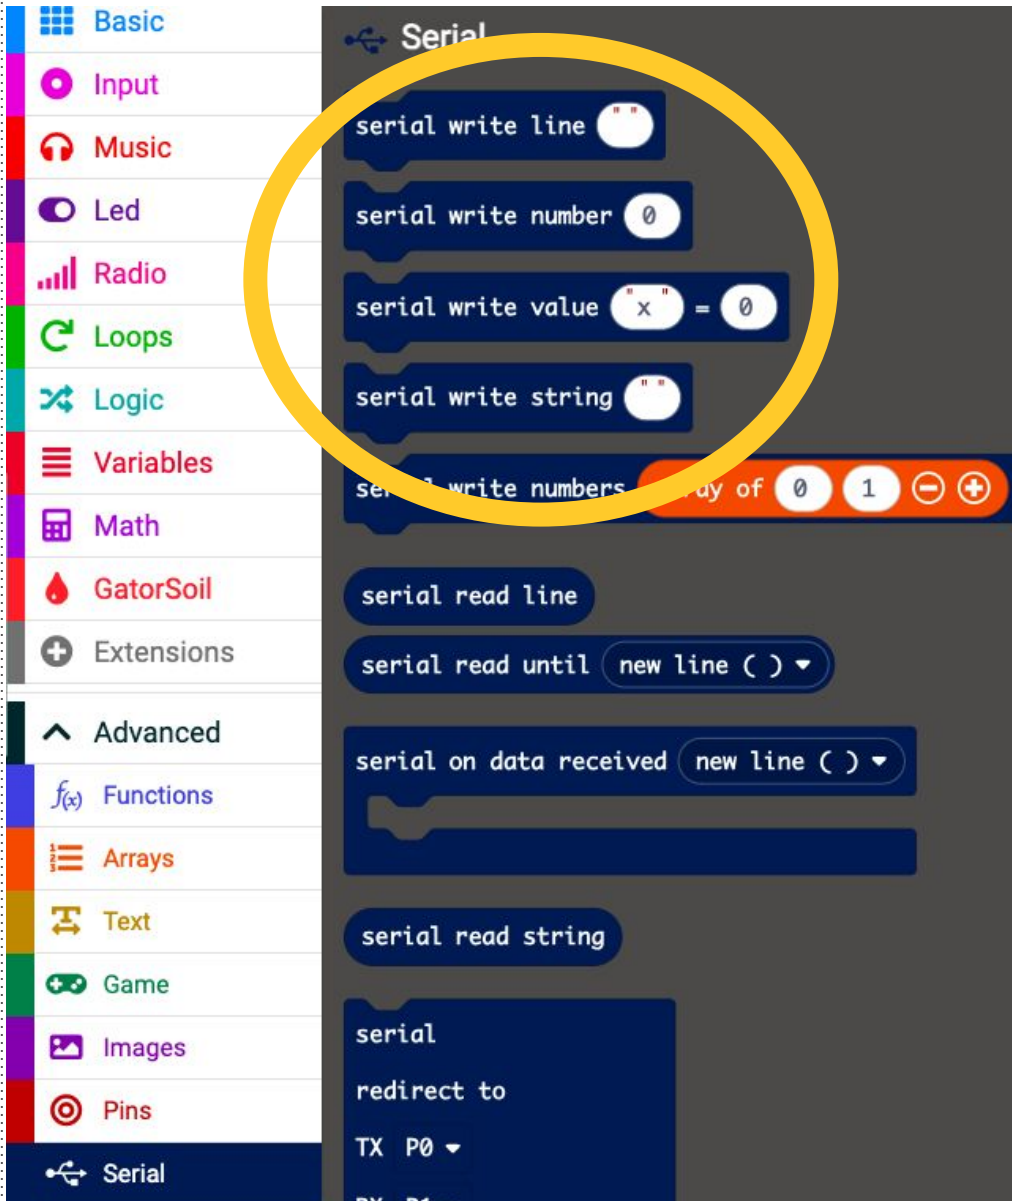

“for element ‘value’ of ‘list’” means that the loop is going to read everything in the list in order and call it ‘value.’ this means you can now do things with each ‘value’ in the list!

serial

micro:bit
advanced

you can also send information from your micro:bit to a computer or an ipad using a serial connection.

this lets you read and save a whole array in makecode, rather than the micro:bit led screen

serial

Show data Simulator

micro:bit advanced

you can also send information from your micro:bit to a computer or an ipad using a serial connection.

this lets you read and save a whole array in makecode, rather than the micro:bit led screen

← Go back

Your data: 128

sample code

here's some (incomplete) code for the sensor. what does each line do?

how could you improve it? what is it missing?

A screenshot of a Scratch script editor showing a sequence of code blocks for a sensor project. The script starts with an "on start" block containing a "radio set group" block with the value 42. This is followed by an "every 60000 ms" loop containing four "show string" blocks (for moisture, light level, and temperature) and an "add value" block for the light level. Below this is an "on button A pressed" block with a "for element" loop that iterates over the "light" list and sends the value via radio. Finally, there is an "on radio received" block that shows a "dots" icon and writes the received number to the serial console as "Your data: [receivedNumber]".

```
on start
  radio set group 42

every 60000 ms
  show string get moisture on pin P0 in soilMoisture using power pin P3
  show string light level
  show string temperature (°C)
  light add value light level to end

on button A pressed
  for element value of light
  do
    radio send number value

on radio received receivedNumber
  show icon dots
  serial write line join "Your data: " receivedNumber
```

CREATING THE SOLUTION — micro:bit

Demonstrate excellent technical skills when making the solution

Document your process of writing your code. Show me some of the steps you take while building your design.

... describe what is being depicted.
(Add annotations and arrows to your pictures, too!)

D // EVALUATING YOUR IDEAS

For this section your journal must provide evidence that:

Diii // DESCRIBE

describe how the solution could be improved

Diii // DESCRIBE

describe how the solution could be improved

Once your system is fully assembled and your plant is placed in its pot, begin testing and collecting data.

Analyze the following:

1. Is the plant positioned in an optimal location?
2. Do the environmental conditions align with your initial research?
3. What adjustments are necessary (e.g., repositioning the plant, modifying watering levels, adjusting light exposure)?

Final Reflection Questions:

- A. To what extent did your design meet the needs of your plant?
- B. What insights did the collected data reveal?
- C. What improvements would you implement in a future iteration?

KEEP YOUR REFLECTION
BRIEF! ONE OR TWO
SENTENCES SHOULD BE
ENOUGH.
